

DSA0502 – Query Processing for Data Science	
Course Faculty	Dr. B .SHYAMALA GOWRI
Reg. No.	192324164
Student Name	Sweety Roselin A
Date	30/07/2026

CO2 AT1 – DEIGN AND CONNECTIVITY

Scenario 1: University Student Management System

A university manages information related to students, faculty members, departments, courses, and examinations. Currently, student information is stored in spreadsheets by different departments, resulting in duplicated records, inconsistent student IDs, and difficulties in generating reports. The university administration wants to develop a centralized database system that can store student details, course enrollments, faculty assignments, attendance records, and examination results. Students should be able to register for multiple courses, while each course may have multiple students enrolled. Faculty members may teach several courses within a semester. The management also requires reports such as department-wise student strength, faculty workload, and student performance statistics. Design an appropriate database schema by identifying entities, attributes, primary keys, foreign keys, and relationships. Connect the database using Python and demonstrate CRUD operations for managing student records.

Table 1: Department

Column Name	Data Type	Key
DepartmentID	INTEGER	PK
DepartmentName	TEXT	
HOD	TEXT	

Table 2: Student

Column Name	Data Type	Key
StudentID	INTEGER	PK
Name	TEXT	
Gender	TEXT	

DOB	DATE	
Phone	TEXT	
Email	TEXT	
DepartmentID	INTEGER	FK → Department(DepartmentID)

Table 3: Faculty

Column Name	Data Type	Key
FacultyID	INTEGER	PK
FacultyName	TEXT	
Qualification	TEXT	
Phone	TEXT	
DepartmentID	INTEGER	FK → Department(DepartmentID)

Table 4: Course

Column Name	Data Type	Key
CourseID	INTEGER	PK
CourseName	TEXT	
Credits	INTEGER	
FacultyID	INTEGER	FK → Faculty(FacultyID)

Table 5: Enrollment

Column Name	Data Type	Key
EnrollmentID	INTEGER	PK
StudentID	INTEGER	FK → Student(StudentID)
CourseID	INTEGER	FK → Course(CourseID)
Semester	TEXT	

Table 6: Attendance

Column Name	Data Type	Key
-------------	-----------	-----

AttendanceID	INTEGER	PK
StudentID	INTEGER	FK → Student(StudentID)
CourseID	INTEGER	FK → Course(CourseID)
AttendancePercentage	REAL	

Table 7: Examination

Column Name	Data Type	Key
ExamID	INTEGER	PK
StudentID	INTEGER	FK → Student(StudentID)
CourseID	INTEGER	FK → Course(CourseID)
Marks	INTEGER	
Grade	TEXT	

2. Relationships

- Department → Student (**1 : Many**)
- Department → Faculty (**1 : Many**)
- Faculty → Course (**1 : Many**)
- Student ↔ Course (**Many : Many**) through Enrollment
- Student → Attendance (**1 : Many**)
- Student → Examination (**1 : Many**)

3. Primary Keys & Foreign Keys

Table	Primary Key	Foreign Key
Department	DepartmentID	—
Student	StudentID	DepartmentID
Faculty	FacultyID	DepartmentID
Course	CourseID	FacultyID
Enrollment	EnrollmentID	StudentID, CourseID
Attendance	AttendanceID	StudentID, CourseID
Examination	ExamID	StudentID, CourseID

SQLite Database using Python

```
import sqlite3

conn = sqlite3.connect("university.db")

cursor = conn.cursor()

cursor.execute("""
CREATE TABLE IF NOT EXISTS Department(
DepartmentID INTEGER PRIMARY KEY,
DepartmentName TEXT,
HOD TEXT
)
""")

cursor.execute("""
CREATE TABLE IF NOT EXISTS Student(
StudentID INTEGER PRIMARY KEY,
Name TEXT,
Gender TEXT,
DOB TEXT,
Phone TEXT,
Email TEXT,
DepartmentID INTEGER,
FOREIGN KEY(DepartmentID) REFERENCES Department(DepartmentID)
)
""")

conn.commit()
```

CRUD Operations

Create (Insert)

```
cursor.execute("INSERT INTO Department VALUES (1,'CSE','Dr. Kumar')")

cursor.execute("""
INSERT INTO Student
```

VALUES

```
(101,'John','Male','2005-03-12','9876543210',  
'john@gmail.com',1)  
""")  
conn.commit()
```

Read (Select)

```
cursor.execute("SELECT * FROM Student")
```

```
for row in cursor.fetchall():  
    print(row)
```

Update

```
cursor.execute("""  
UPDATE Student  
SET Phone='9999999999'  
WHERE StudentID=101  
""")  
conn.commit()
```

Delete

```
cursor.execute("""  
DELETE FROM Student  
WHERE StudentID=101  
""")  
conn.commit()  
conn.close()
```

Expected Reports

- Department-wise Student Strength

```

SELECT DepartmentName, COUNT(StudentID)
FROM Department
JOIN Student
ON Department.DepartmentID=Student.DepartmentID
GROUP BY DepartmentName;

```

- Faculty Workload

```

SELECT FacultyID, COUNT(CourseID)
FROM Course
GROUP BY FacultyID;

```

- Student Performance

```

SELECT StudentID, AVG(Marks)
FROM Examination
GROUP BY StudentID;

```

Scenario 6: Banking and Customer Account Management System

A commercial bank manages savings accounts, current accounts, loans, and customer transactions. Customers may own multiple accounts, and each account contains transaction records such as deposits, withdrawals, and transfers. The bank requires a secure database system to store customer information, account details, branch information, and loan records. Managers need reports on customer balances, transaction histories, and loan repayments. The system must support quick retrieval of information and ensure data consistency. Design the database schema, define relationships between customers and accounts, and implement Python-based database connectivity for account management

Scenario 6: Banking and Customer Account Management System

Table 1: Customer

Column Name	Data Type	Key
CustomerID	INTEGER	PK
CustomerName	TEXT	
Address	TEXT	
Phone	TEXT	
Email	TEXT	

Table 2: Branch

Column Name	Data Type	Key
BranchID	INTEGER	PK
BranchName	TEXT	
Location	TEXT	

Table 3: Account

Column Name	Data Type	Key
AccountNumber	INTEGER	PK
AccountType	TEXT	
Balance	REAL	
CustomerID	INTEGER	FK → Customer(CustomerID)
BranchID	INTEGER	FK → Branch(BranchID)

Table 4: Transaction

Column Name	Data Type	Key
TransactionID	INTEGER	PK
AccountNumber	INTEGER	FK → Account(AccountNumber)
TransactionType	TEXT	
Amount	REAL	
TransactionDate	DATE	

Table 5: Loan

Column Name	Data Type	Key
LoanID	INTEGER	PK
CustomerID	INTEGER	FK → Customer(CustomerID)
LoanAmount	REAL	
LoanType	TEXT	
RepaymentStatus	TEXT	

2. Relationships

- Customer → Account (**1 : Many**)
- Branch → Account (**1 : Many**)
- Account → Transaction (**1 : Many**)
- Customer → Loan (**1 : Many**)

3. Primary Keys & Foreign Keys

Table	Primary Key	Foreign Key
Customer	CustomerID	—
Branch	BranchID	—
Account	AccountNumber	CustomerID, BranchID
Transaction	TransactionID	AccountNumber
Loan	LoanID	CustomerID

SQLite Database using Python

```
import sqlite3

conn = sqlite3.connect("bank.db")

cursor = conn.cursor()

cursor.execute("""
CREATE TABLE IF NOT EXISTS Customer(
CustomerID INTEGER PRIMARY KEY,
CustomerName TEXT,
Address TEXT,
Phone TEXT,
Email TEXT
)
""")

cursor.execute("""
```

```

CREATE TABLE IF NOT EXISTS Branch(
BranchID INTEGER PRIMARY KEY,
BranchName TEXT,
Location TEXT
)
)
)
cursor.execute("""
CREATE TABLE IF NOT EXISTS Account(
AccountNumber INTEGER PRIMARY KEY,
AccountType TEXT,
Balance REAL,
CustomerID INTEGER,
BranchID INTEGER,
FOREIGN KEY(CustomerID) REFERENCES Customer(CustomerID),
FOREIGN KEY(BranchID) REFERENCES Branch(BranchID)
)
)
)
conn.commit()

```

CRUD Operations

Create (Insert)

```

cursor.execute("""
INSERT INTO Customer
VALUES
(1,'Alice','Chennai','9876543210','alice@gmail.com')
)
)
cursor.execute("""
INSERT INTO Branch
VALUES
(101,'Anna Nagar Branch','Chennai')
)
)

```

```
""")
cursor.execute("""
INSERT INTO Account
VALUES
(5001,'Savings',25000,1,101)
""")
conn.commit()
```

Read (Select)

```
cursor.execute("SELECT * FROM Account")
for row in cursor.fetchall():
    print(row)
```

Update

```
cursor.execute("""
UPDATE Account
SET Balance=30000
WHERE AccountNumber=5001
""")
conn.commit()
```

Delete

```
cursor.execute("""
DELETE FROM Account
WHERE AccountNumber=5001
""")
conn.commit()
conn.close()
```

Expected Reports

Customer Balances

```
SELECT CustomerName, Balance
FROM Customer
JOIN Account
ON Customer.CustomerID = Account.CustomerID;
```

Transaction History

```
SELECT *
FROM Transaction
WHERE AccountNumber = 5001;
```

Loan Repayment Status

```
SELECT CustomerName, LoanAmount, RepaymentStatus
FROM Customer
JOIN Loan
ON Customer.CustomerID = Loan.CustomerID;
```
